# "Hello from the other side" workshop

Add your idea to improve the UX of messaging asymmetries!

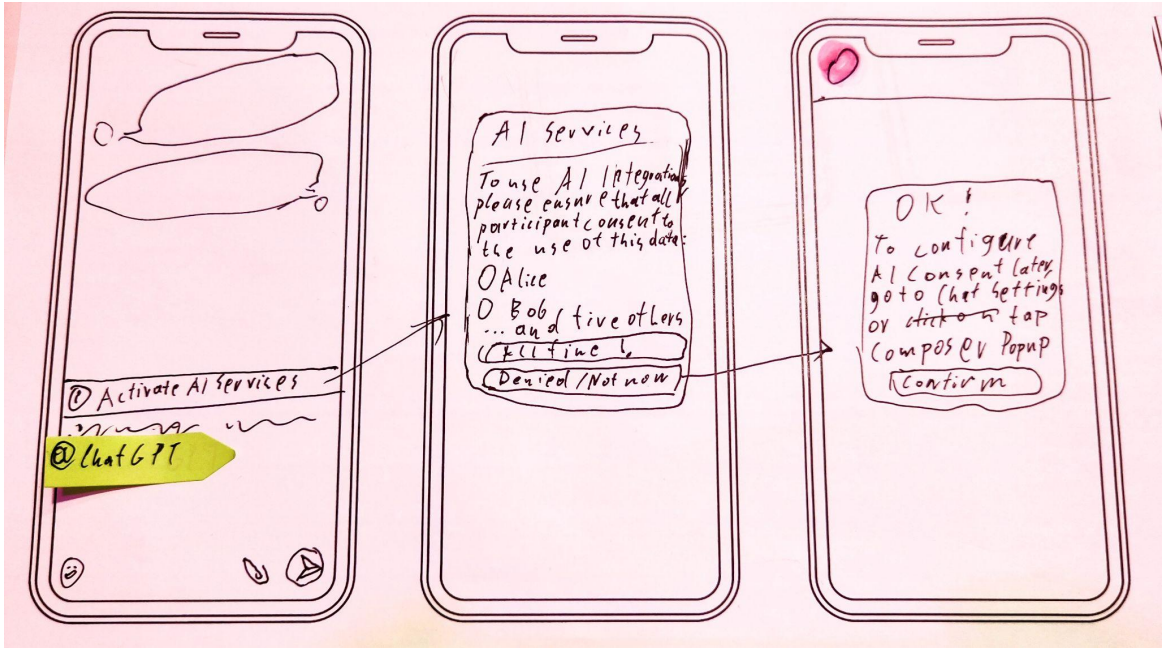

# [Template! Please copy, don't edit] Title for your idea

Brief explanation, for example:

- How does your design help users have a better UX of asymmetries?
- Was seamful design useful? How?
- Why did this asymmetry matter to you?

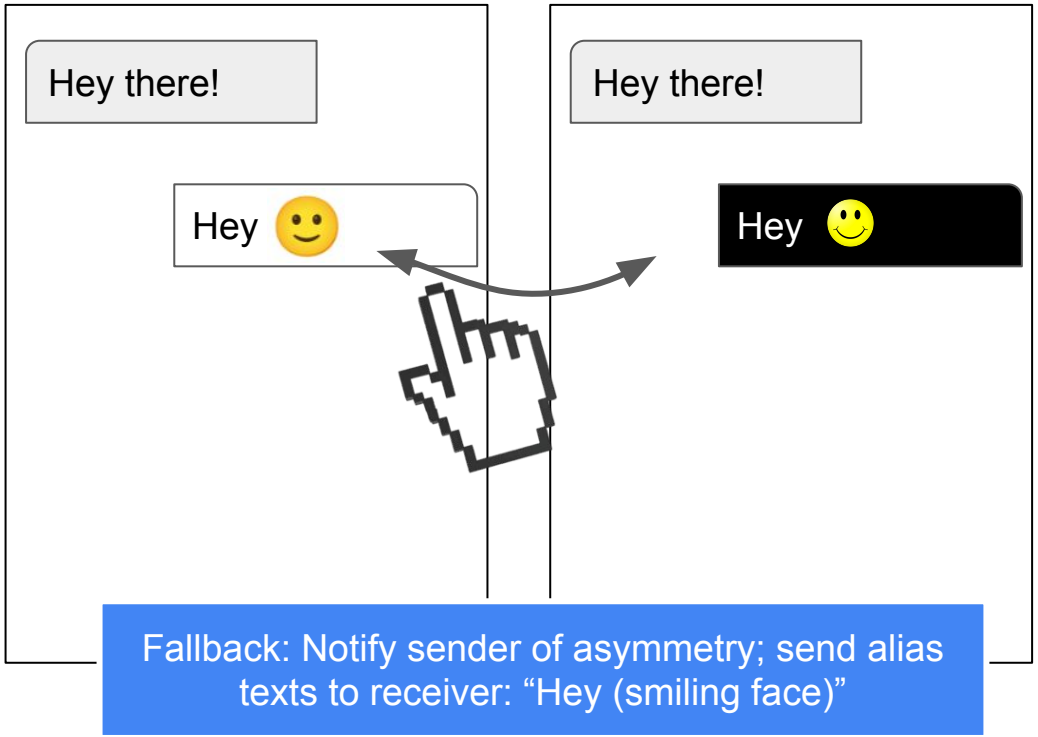

# AI Integration consent

Brief explanation:

- When the sender mentions an AI integration in composer, as them to confirm everyone's consent.
- Tell the sender about the risks.
- Don't solve this on other clients. The user should inform their friends.

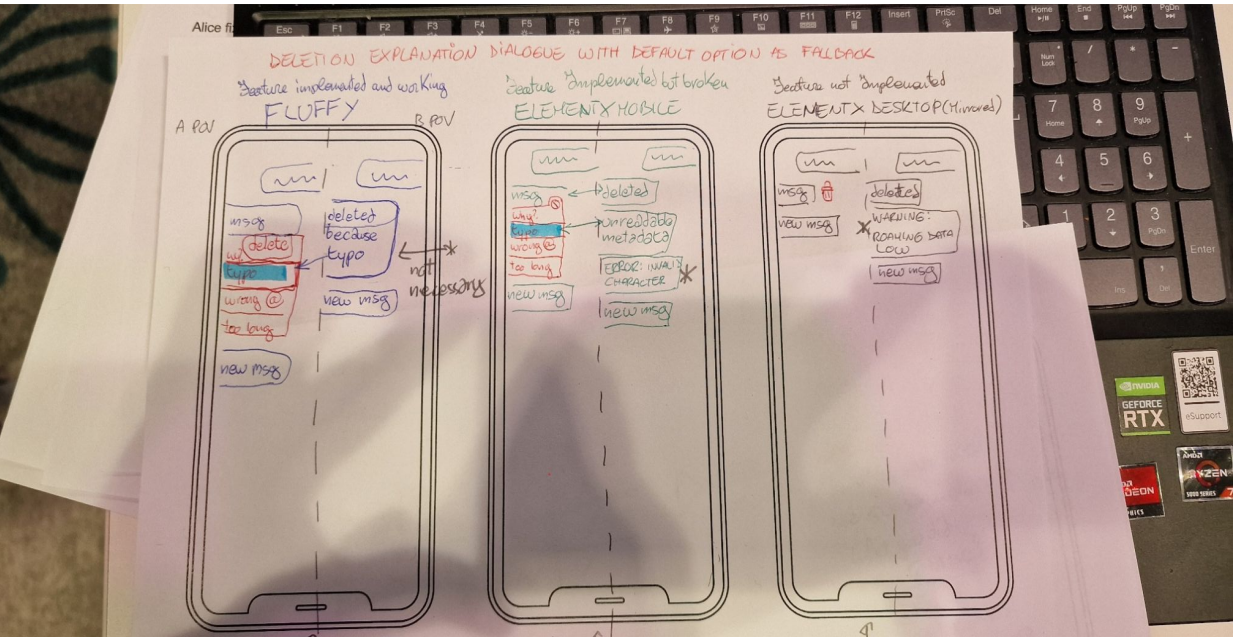

# Preview the Other Side

Brief explanation, for example:

- Make both sides aware of what the other side looks like
- Seamful: Fallback option when something did not work

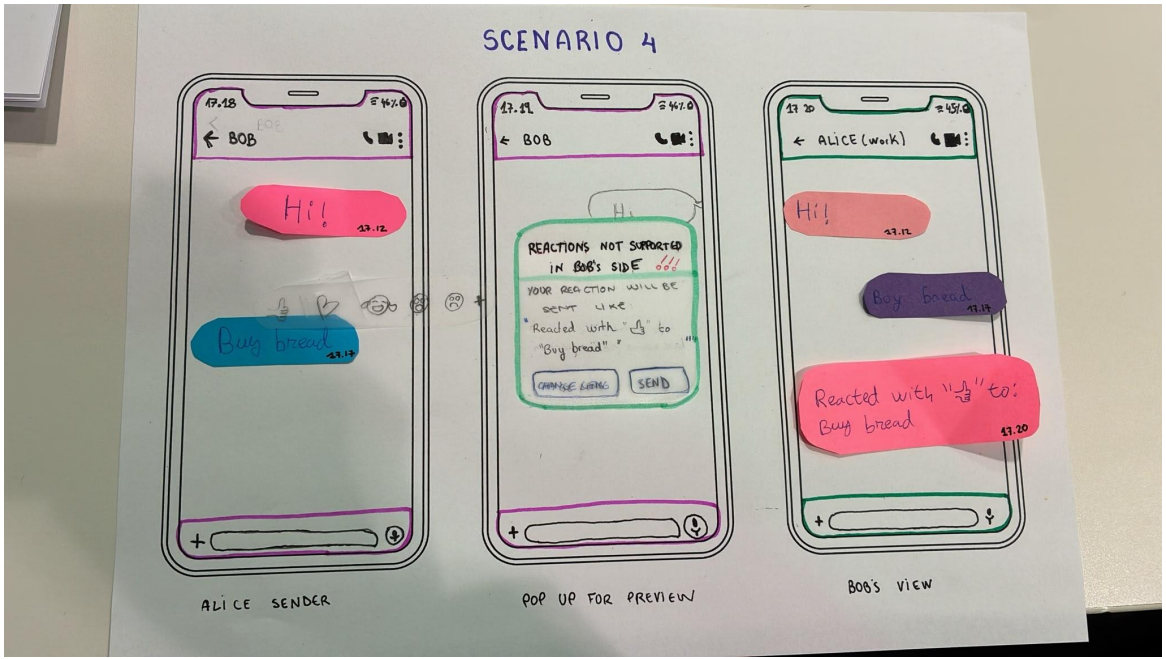

# Deletion Explanation Dialogue With Default Option as Fallback

Brief explanation, for example:

- It allows users to attach context to their deletions
- It gaps the uncertainty between users of different incompatible systems
- Communication is more transparent by not leaving space for misinterpretation

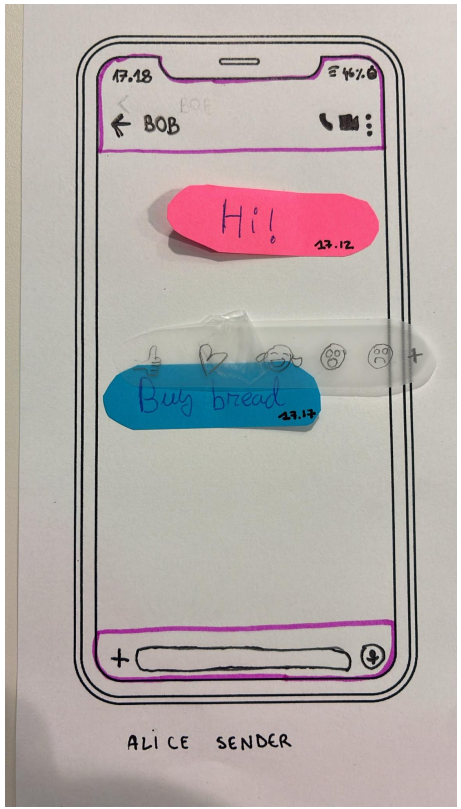

# SCENARIO 4

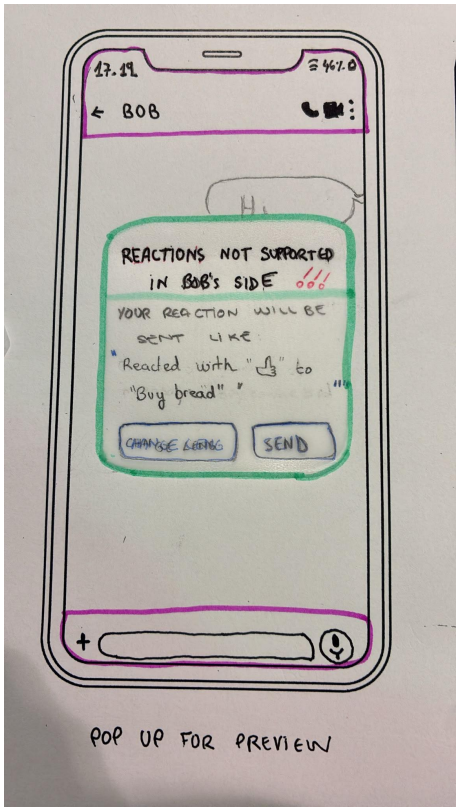

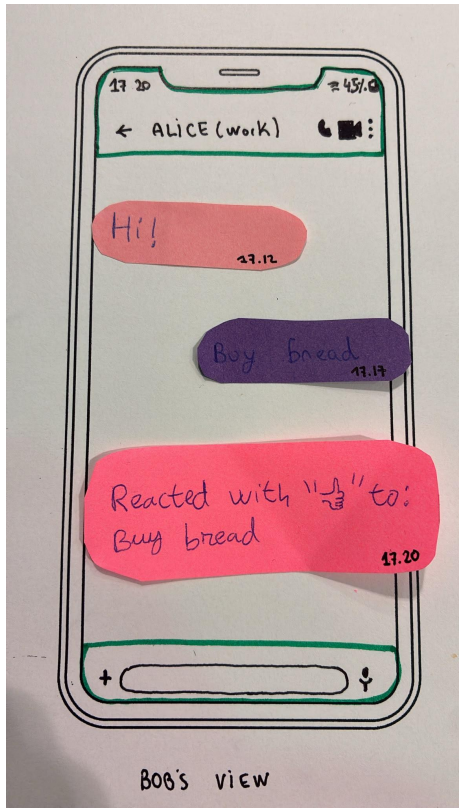

Brief explanation:

- Now sender can see receiver's preview and a button to change reaction text language.
- Receiver will see now correct reaction language since he can't see the actual reaction.

# SCENARIO 4 - Closer look

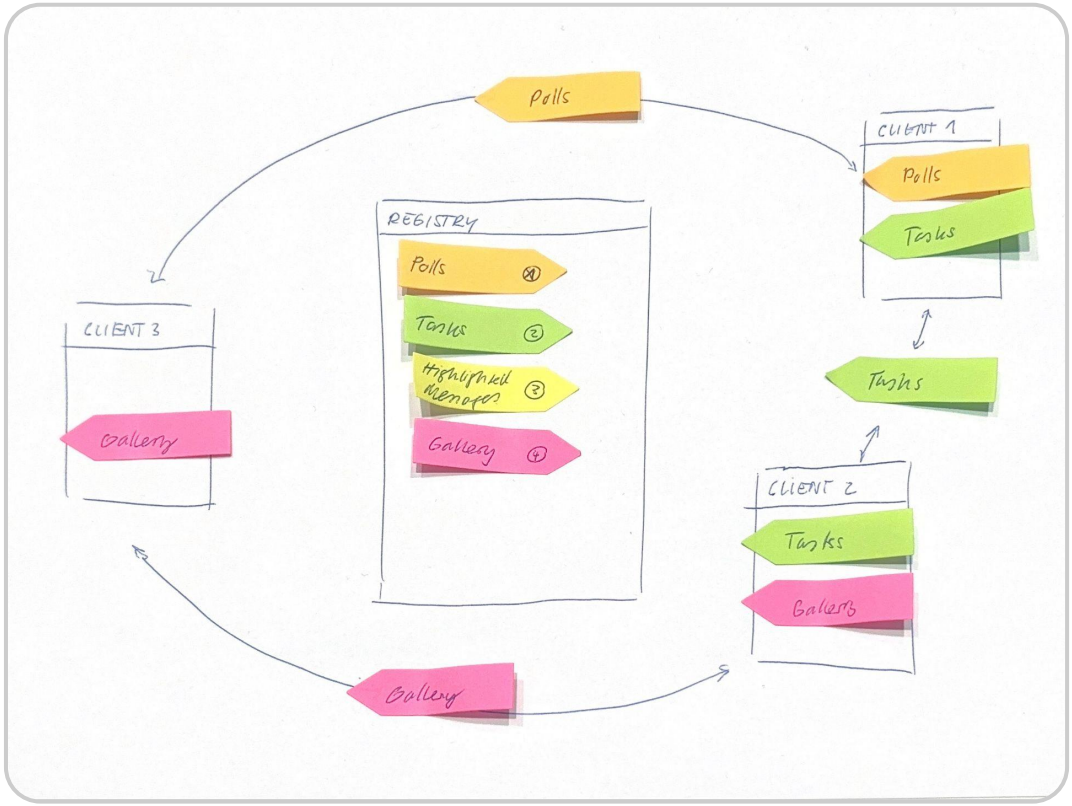

# SCENARIO 5

- Clients should have a way to “advertised” which features they support
- Features are advertised in the user profile
- Depending on the features the receiving client supports, features are available or not

# SCENARIO 5

- To know about which features are supported by a given client, we need a shared “registry” of supported features where each feature has a fixed ID
- This is not the same as the specification. It is rather an augmentation.
